

column_name :

The NFA diagram for 'column_name' starts with a start state leading to an '@' terminal symbol. From there, it branches into four paths that converge at a final state. The first path goes through 'identifier' to a choice of '[<integer value>]' or '[<integer value> , <integer value>]'. The second path goes through '<tablename>' and '.' to 'identifier', which then branches to the same two choices. The third path goes through 'identifier', '.', 'identifier', and '.' to 'identifier', which then branches to the same two choices. The fourth path goes through '<tablename>' and '.' to a '*' terminal symbol.
