

column\_name :

The NFA diagram for 'column\_name' starts with a start state leading to an '@' terminal symbol. From there, it branches into four paths. The first path goes to 'identifier', which then branches into two options: a single '[' terminal followed by '<integer value>' and a closing ']' terminal, or an opening '[' terminal, '<integer value>', a comma ',', another '<integer value>', and a closing ']' terminal. The second path goes to '<tablename>', then a '.' terminal, then 'identifier', which then branches into two options: a single '[' terminal followed by '<integer value>' and a closing ']' terminal, or an opening '[' terminal, '<integer value>', a comma ',', another '<integer value>', and a closing ']' terminal. The third path goes to 'identifier', then a '.' terminal, then 'identifier', then a '.' terminal, then 'identifier', which then branches into two options: a single '[' terminal followed by '<integer value>' and a closing ']' terminal, or an opening '[' terminal, '<integer value>', a comma ',', another '<integer value>', and a closing ']' terminal. The fourth path goes to '<tablename>', then a '.' terminal, then an '\*' terminal. All four paths converge to a final state.
